## STREET MAINTENANCE PLAN

### EXECUTIVE SUMMARY

Freeland Turk Engineering Group, LLC (FTEG) prepared this Street Maintenance Plan and sign inventory, as per our agreement. A summary of our approach, assumptions, observations, conclusions, and recommendations related to the development of this plan is provided in this report.

FTEG utilized Roadbotics technology to collect street data on December 5 and 8, 2023 for the approximate 40 centerline miles of City maintained public roadways.

This is the second time FTEG has provided this service for the City of Smithville. In 2019 we utilized Roadbotics and issued a similar maintenance plan in January 2020 that identified various maintenance activity on 106 street segments. Out of those 106 street segments, 56 segments were identified for significant restoration and repaving. In the last four years, the City has made significant progress towards working on the streets and has performed maintenance activities on 26 out of the 56 severely rated street segments, or taking on a project about every other month for the last four years. In addition to taking care of street segments identified in the Roadbotics report, the City has also performed maintenance on areas that were not covered by the Roadbotics report such as Mt. Pleasant Cemetery, Oak Hills Cemetery, RVICS, and the airport. The City should continue to budget for, and maintain, the more severely rated streets over the next few years.

Roadbotics provides a rating level at approximate 10' intervals along every roadway and assigns a level for each point. Each point is combined along a roadway segment, typically block to block, or intersection to intersection (such as alleys) and the collective segment is assigned an average rating. There are 850 street segments in the Smithville assessment. Some segments were combined to be congruent with streets. A description of the ratings along with the percentage of Smithville street segments falling into those categories are described below:

Level 1 "Green" = 1.00 to 1.49 – 3.76% (32 of the 850 segments) were rated Level 1. No or very minor surface damage. This road may be a newly paved roadway.

Level 2 "Light Green" = 1.5 to 2.49 – 22.35% (190 of the 850 segments) were rated Level 2. Minor surface damage, no critical issues. This road is starting to show typical wear and tear.

Level 3 “Yellow” = 2.5 to 3.49 – 49.18% (418 of the 850 segments) were rated Level 3. Appearance of pervasive surface distresses. Important surface issues are starting to show.

Level 4 “Orange” = 3.5 to 4.49 – 21.65% (184 of the 850 segments) were rated Level 4. Significant damage or emerging critical failures. Road damage is beginning to intensify.

Level 5 “Red” = 4.5 to 5.00 – 2.12% (18 of the 850 segments) were rated Level 5. Major surface damage and/or critical surface failures are present on the road surface.

Not Rated “Gray” = No Score – 0.94% (8 of the 850 segments) were not rated. Unpaved or dirt roadways will fall into this category. Occasionally, a severely deteriorated paved roadway, or a chip sealed roadway with light colored or brown colored gravel will fall into this category.

For this Maintenance Plan, Level 4 and 5 rated streets (scores 3.5-5) were prioritized and provided recommendations for maintenance activities.

The sign inventory captured approximately 600 signs within the City of Smithville, with recommendations to replace just over 50 of these signs.

---

## DESKTOP ASSESSMENT AND ANALYSIS

Using the Roadbotics data, FTEG performed a desktop assessment and analysis of Smithville’s existing street pavements. The Roadbotics data, along with Google Earth, USGS Topography and other miscellaneous information were used to provide this analysis.

---

## FIELD VISITS

Windshield observations were made to verify specific areas where desktop information sources were inadequate for a conclusive assessment and analysis for the roadway system. Field visits were also made to review the sign data for the sign inventory.

---

## MAINTENANCE ACTIVITY RECOMMENDATIONS

FTEG identified recommended maintenance activities for each segment of paved public street in Smithville, except for TxDOT or County facilities, alleys, private streets, gravel/dirt streets and street rights-of-way with no improvements. The specific maintenance activities and improvements identified in this plan are intended to keep, or restore, a street’s pavement to a good (or better) quality rating. The Maintenance Plan can be found in Appendix A.

---

## PRESERVATION ACTIVITIES

Many of Smithville's streets are situated in areas of relatively flat topography with limited storm drain conveyance systems (inlets, storm drains, roadside ditches, etc.). As such, slow moving stormwater runoff and water ponding can cause many streets to experience accelerated deterioration.

The scale of this issue presents a significant street maintenance challenge for Smithville. Of all maintenance type activities, preservation is the cheapest and most cost-effective approach to keeping pavement in good condition.

*Sweeping and Silt/Debris Removal* – The accumulation of silt and debris hinders the flow of stormwater runoff on pavement. The streets in Smithville should be swept at least quarterly, or more often as needed. Streets in flat areas should be given priority when resources are an issue.

*Vegetation Removal* – The existence of vegetation is an indication of pavement cracking and deterioration of base material. Vegetation should be removed chemically if it is unable to be regulated by sweeping, and until the area can be repaired by patching.

*Crack Sealing* – Cracks more than 1/16-inch-wide should be sealed with appropriate crack sealing material when observed or, at a minimum, on an annual basis. Visible cracks and curb seams should be sealed on a 2 or 3-year cycle.

*Patching* – Areas of distressed pavement, like potholes and alligator cracking, should be patched by saw cutting at least one foot outside the distressed area(s), removing the material (at least six inches depth), properly recompacting the subgrade material and installing at least 6 inches of hot mix asphaltic concrete (HMAC). The full depth HMAC patching approach enables the pavement to better resist surface moisture. Also, the HMAC is relatively easy and quick to install, saving street maintenance crew time and reducing inconvenience to the traveling public.

*Concrete Aprons* – Concrete aprons and valley gutters should be installed in areas where water ponding cannot be mitigated and/or significant storm water runoff flows down or across a street. Concrete surfaces improve stormwater runoff and resist surface moisture better than asphalt.

---

## REHABILITATION ACTIVITIES

Rehabilitation maintenance activities are generally done to replace the existing pavement surfaces and include mill and overlay and chip seals. Both approaches are commonly used in Texas and are considered cost-effective.

*Chip Seal* - Seal coats are typically recommended for use in low volume traffic areas where the existing pavement surface has experienced significant wear, including raveling or loss of

aggregate. Prior to application of the single course chip seal, the existing surface is prepared by crack sealing, patching and applying level-up asphalt.

*Mill and Overlay* – HMAC overlays are typically recommended for use in higher volume traffic areas, arterials, truck routes and where better ride quality is desired. They are used to replace existing asphalt pavement surfaces that exhibit significant wear, patching and/or cracking. Prior to the application of typically 2” of HMAC overlay, the existing asphalt surface is removed by milling, the base material in distressed areas is replaced and, if needed, level-up is applied to fill in depressions.

---

## RECONSTRUCTION

Reconstruction is typically recommended when a street has experienced significant deterioration of the pavement surface, base material and subgrade. In these areas, salvaging the pavement is not cost-effective and new materials must be used. The recommended approach involves replacing the base material and pavement surface “in-place” or at the same line and grade of the existing street. The existing surface and base materials are excavated and removed. The subgrade is proof rolled and properly compacted or stabilized prior to placement with new flexible base material. HMAC is installed in higher volume traffic areas, arterials, truck routes and where better ride quality is desired. A two course chips seal is applied in lower traffic volume areas. Curbing may also be installed or replaced as needed to help preserve the integrity of the new materials.

An alternative to replacing “in-place” reconstruction is street reclamation. This approach involves grinding the existing base and surface material, adding an asphaltic oil emulsion, recompacting the mixed material, and installing a HMAC or two course chip seal to complete the surface. This approach requires the presence of existing quality base material.

---

## FULL RECONSTRUCTION

Full reconstruction involves new construction of all street components and usually involves geometric changes, regrading, storm drain systems, utilities, etc. This approach would typically be recommended for mitigating the root cause to a chronic problem (e.g. drainage). We recommend the City conduct further engineering evaluations to identify potential candidate projects for streets that are causing recurring street maintenance problems in Smithville. We recommend preservation activities continue for these streets while studies are underway. However, it is suggested that street rehabilitation or reconstruction be deferred until engineering studies can be completed to identify these potential candidate projects.

---

## PRIORITIZATION OF PROJECTS

The streets for the maintenance plan were prioritized based streets ranked four or five in the Roadbotics Assessment.

---

## STREET MAINTENANCE PLAN

The plan consists of a list of Level 4 and 5 streets. The plan can be found in Appendix A. The contents are summarized below:

*Street* – Name of public paved street owned and maintained by the City of Smithville.

*Street Limits* – Beginning and end of the street segment.

*Street Length* – Length of street segment between center of intersections or end point(s) as computed by RoadBotics data.

*Maintenance Activity Type* – Recommended preservation, rehabilitation or reconstruction activities needed to restore the given street segment to good (or better) pavement condition.

---

## SIGN INVENTORY

The sign inventory was prepared by taking pictures of the approximate 600 various signs throughout the City and georeferencing those using a KMZ file in Google Earth Pro, creating an interactive database for viewing. An accompanying spreadsheet/table included in Appendix B references signs that may need to be replaced in the City and signs that may be missing at different locations. Other signs may appear to be weathered or dirty and could be improved by cleaning or pressure washing the face of the signs as determined by City Staff.

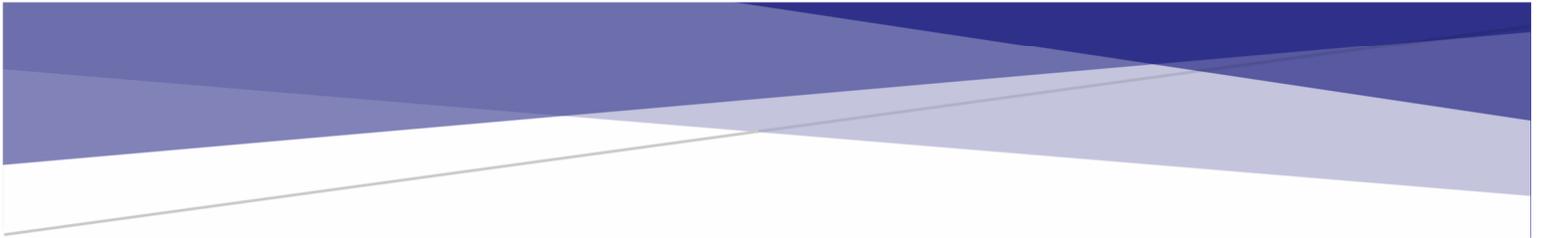

---

## CONCLUSION

FTEG utilized the Roadbotics collection system, the accompanying data, and on-site observations in order to assess the street conditions of the City and prepare a maintenance plan for the City. This maintenance plan will bring the City's streets, that are ranked four or five in the Roadbotics database, into better condition and help prevent further deterioration of those City's streets. This plan should not over-prioritize the streets within this plan and maintenance activities should be implemented to maintain the integrity of those streets not included in this plan.

The sign inventory can be used to replace degraded signs and install signs that may be missing at certain locations throughout the City.
